

WELLNESS IS A PROFITABLE CHOICE FOR JERSEYS

GENETICALLY SELECT HEIFERS TO BUILD A MORE PROFITABLE HERD

With CLARIFIDE® Plus, you can improve herd health with genetic testing and selection. Profitable Jersey cows are more fertile, productive, healthy and long-lived. They require fewer treatments and are more likely to remain in the herd longer. CLARIFIDE Plus allows you to make selections based on wellness and fertility traits that impact profitability.

CLARIFIDE Plus is the first and only genomic test that delivers information on all these traits:

- **Eight cow wellness traits** — mastitis, lameness, metritis, retained placenta, displaced abomasum, ketosis, milk fever and respiratory disease
- **Three additional fertility traits** — cystic ovary, abortion and twinning
- **Three calf wellness traits** — calf liveability, respiratory disease and scours

These genetic predictions are based on data collected from millions of health records.

The expanded suite of genomic insights enhances your ability to make decisions that incorporate fertility traits and disease risk. CLARIFIDE Plus indexes balance these factors to help you select the most profitable animals for your herd. This single-sample genetic test provides you with highly relevant information as you seek to improve the health, productivity and profitability of the Jersey cattle in your care.

SELECT AGAINST CONDITIONS THAT IMPACT FERTILITY

With the newest trait additions for CLARIFIDE® Plus, you have even better insights to help avoid costly conditions that impact fertility. The newest traits included in CLARIFIDE Plus results include cow abortion, twinning, cow respiratory disease, cystic ovary and milk fever.

Abortion among dairy cows represents a major economic burden to the dairy industry. Abortion can also increase the risk of other diseases and premature culling.

Twinning reduces your herd's overall profitability from the health impact on cows as well as on calves born as twins.¹ Twinning can result in increased risk for dystocia (difficult calving), retained placenta, metritis, abortion and culling. Research has shown that the mortality rate for twins can be two to three times that of a single calf.²

AVERAGE RELIABILITY AND AVERAGE, MINIMUM AND MAXIMUM GENETIC VALUES FOR JERSEY COW WELLNESS TRAITS, FERTILITY TRAITS AND CALF WELLNESS TRAITS*

	Average % Reliability	Minimum Score (STA)	Maximum Score (STA)
Cow Wellness Traits			
Mastitis	47	75	114
Lameness	42	73	115
Metritis	40	68	114
Retained Placenta	35	70	117
Displaced Abomasum	27	70	115
Ketosis	35	62	114
Milk Fever	36	62	115
Respiratory Disease	27	79	117
Fertility Traits			
Cystic Ovaries	25	80	118
Abortion	30	77	118
Twinning	44	72	112
Calf Wellness Traits			
Calf Liveability	38	72	116
Calf Respiratory	44	77	114
Calf Scours	41	81	115

*Numbers reflect data from reference population of animals under 2 years of age

Average disease risk is represented by an STA value of 100. Values greater than 100 reflect animals with lower expected average risk for the associated disease relative to their herdmates. Selecting for a high STA will apply selection pressure for reduced risk of disease.
